

-Jam session - Won't be build in the first iteration of the application, the reason is because syncing a song between two users is cheap in money, but costly in time and complexity

-Music hosted on a personal server - Won't-have for now; running and hosting the server costs money that isn't currently affordable, revisit once that cost is feasible.

-Accounts/login - Not required for Phase 1; Jam Session works via host creates session / guest joins, no account system needed

-Following other users, sharing playlists externally - Out of scope for Phase 1

-Cross-catalog search, recommendations, genre/artist browsing - App has no catalog, only songs the user has imported

-Multi-device sync - Phase 1 targets a single Android device only

-Audio quality settings (bitrate/EQ) - Not needed

-Lyrics display - Not needed

-Reordering the queue - Not needed
